Private Client Delivery & Approval Portal

Independent software project | Owner: Ismail Habib | Created September 2026

Actual application capture. Any example records are labeled verification inputs.

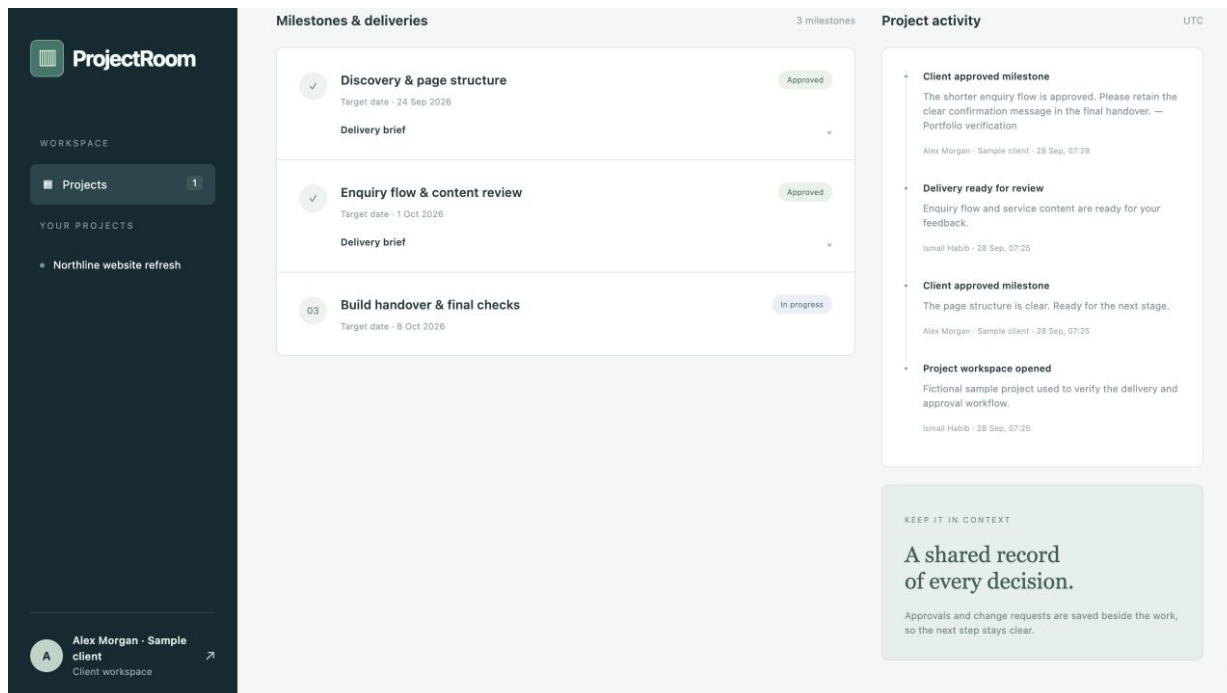

The problem

When project updates, delivery notes and approvals live in separate messages, clients lose context and teams struggle to establish the next agreed step.

What the project delivers

- Native WordPress login and client membership checks
- Private delivery brief downloads behind access checks
- Change request, revision and approval state workflow
- Staff project creation and actor-attributed history

Built to be inspected.

Actual saved client decision with updated milestone status and activity history.

What was verified

24 live WordPress integration checks passed across administrator and two client accounts, covering cross-project read/download/write denial, CSRF protection and the complete review/revision/approval workflow.

How it works

Staff creates milestone to Delivers brief to Client requests changes to Staff revises to Client approves

Current scope

Locally verified independent project with fictional sample clients and project content. One assigned client per project; administrator staff. No file upload, email, invoicing or public hosting. Delivery briefs are private text downloads.

Included: source code, setup guide, tests, screenshots, editable case study and Malt copy.
